

Update on COVID-19 Projections

Science Advisory and Modelling Consensus Tables

April 16, 2021

Key Findings

- COVID-19 cases, hospitalizations and ICU occupancy are **at their highest levels since March 2020** and variant cases continue to rise sharply.
- ICU occupancy is **compromising care for all patients.**
- Ontarians can help themselves and others by limiting mobility to truly necessary trips and **always wearing a mask and keeping 6 feet distant** when in contact with anyone outside their household.
- Although improving, vaccination is not reaching people at high-risk fast enough to overcome the level of serious illness in our communities and our hospitals.
- Without stronger system-level measures and immediate support for essential workers and high-risk communities, **high case rates will persist through the summer.**

Cases are **rapidly** increasing in most Public Health Units

Data source: CCM
 Data note: Data for the most recent day have been censored to account for reporting delays

Test positivity rates are increasing across Ontario

Data source: Ontario Laboratory Information System (OLIS), data up to April 9

Ontario testing rates are flat – the increase in cases is because there are more cases, not more tests being done

Data source: Ontario Laboratory Information System (OLIS), data up to April 9 Specimen Date

The number of variant cases continues to rise and variants now dominate, but even the original strain is rising.

New Variants of Concern (VOCs)

Early Variant (non-VOCs)

A record number of Ontarians are in hospital due to COVID-19

Last 2 weeks:
67% growth in hospitalizations
51% growth in ICU occupancy

Data Sources: MOH COVID Inpatient Census and Critical Care Information System

A 6 week stay-at-home order with a vaccination rate of at least 100K doses per day is the only way to flatten the curve.

Figure summarizes predictions across 4 models with many scenarios.

Stay-at-home order assumptions:

- 4 or 6 weeks starting Apr 8
- Weak to strong effect on transmission

Vaccine assumptions:

- 60% effective in preventing infection
- 100,000 doses/day
- Administered at random

Under every scenario, more vaccines mean a faster resolution in the long-run

As predicted, ICU occupancy is rising dramatically. System-level public health measures will help blunt some of the impact.

Mobility has declined slightly but not enough to bring current growth under control.

Mobility has declined slightly across settings. Further reducing mobility and always wearing a mask and distancing is how Ontarians help reduce cases.

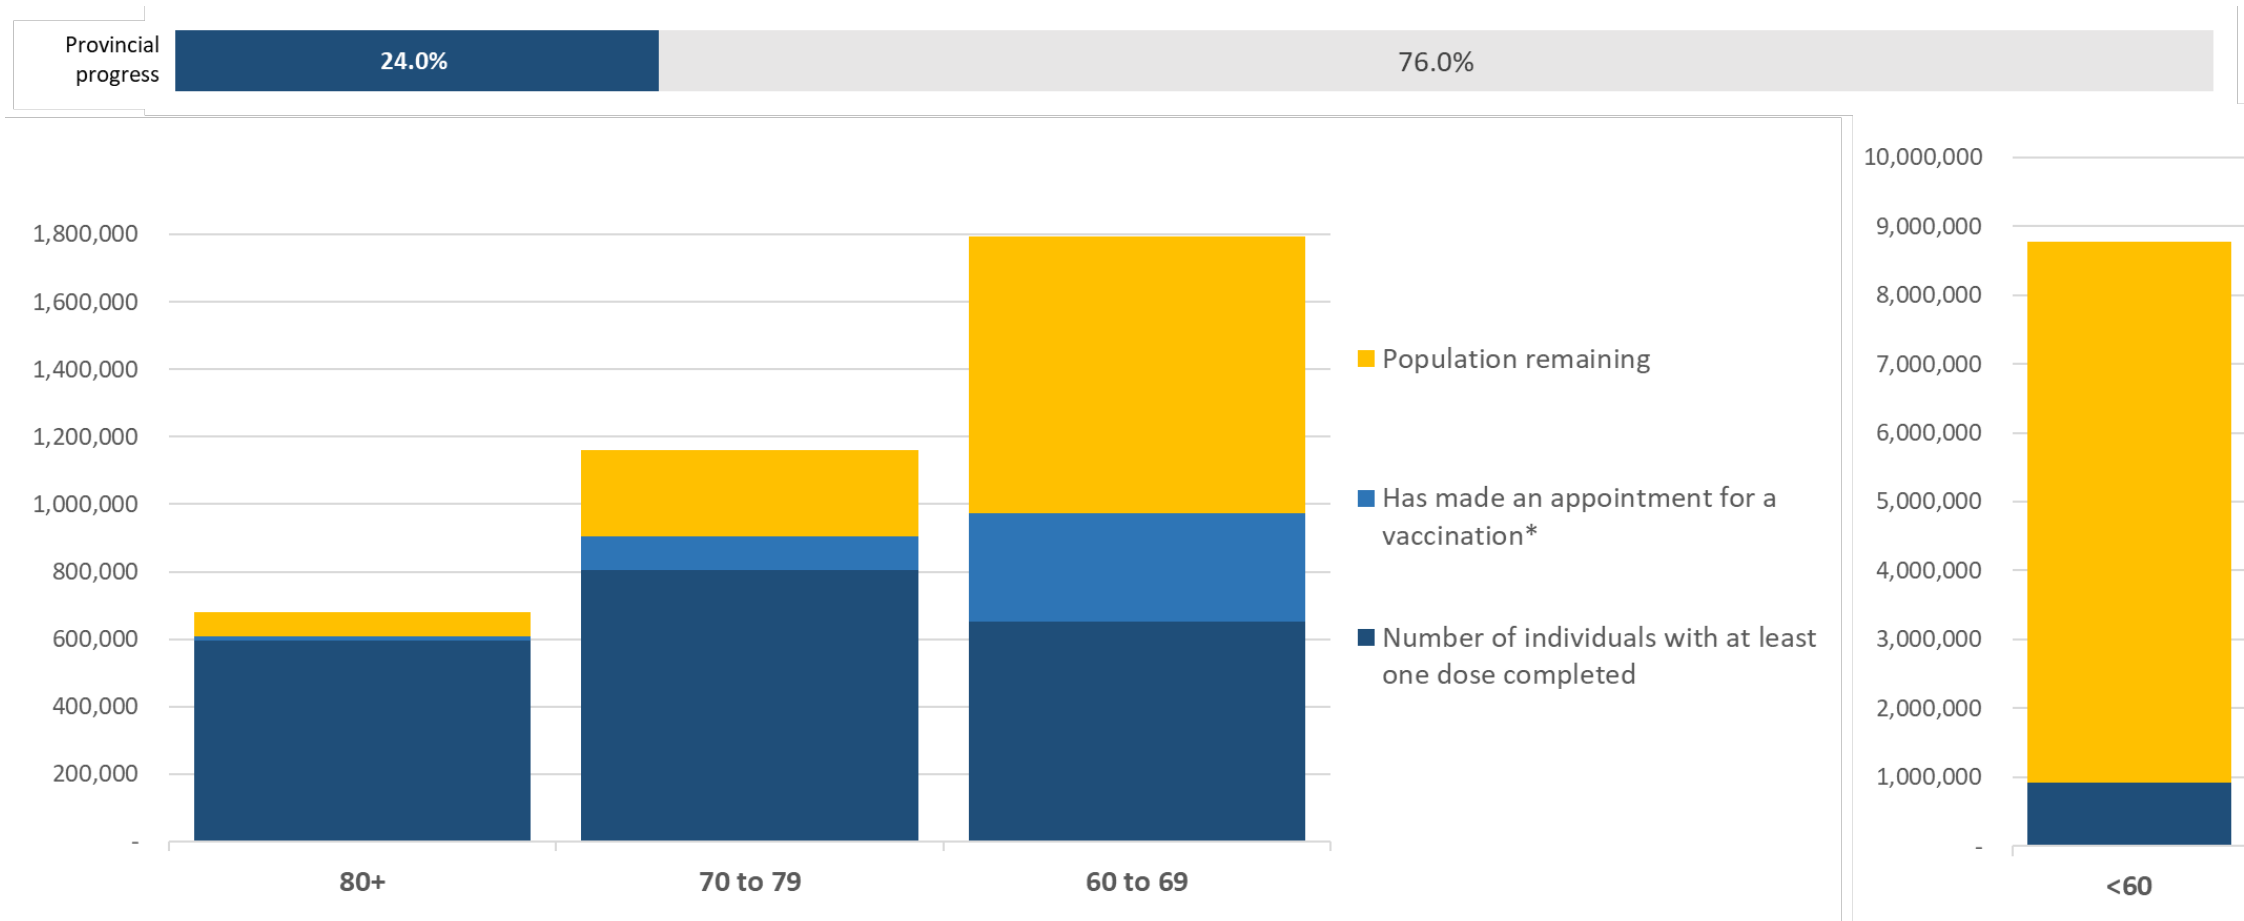

The access to care deficit is building which will be felt by Ontarians well past the pandemic

Data Source: Wait Times Information System. Backlog estimated based on comparison of 2020/21 with 2019/20 surgical volumes

First dose vaccine coverage expanding but remains incomplete

More than 3m doses administered

Data Sources

MOF Population Projections

COVAX analytical file, extracted, 8:00 pm Apr 12 2021, CPAD, MOH

COVAX Skedulo, extracted 6:00pm Apr 12 2021

Vaccination by risk is improving but remains a key to controlling spread

Figure excludes long-term care vaccination – at least 1 dose as of April 12, 2021

Age group	<u>Neighbourhood Risk[‡]</u>										Overall
	1 = high incidence of COVID-19 infections					→	10 = low incidence of COVID-19 infections				
	1	2	3	4	5	6	7	8	9	10	
80+	65%	68%	70%	75%	77%	77%	79%	81%	82%	82%	76%
75-79	63%	68%	70%	73%	75%	74%	75%	77%	74%	71%	72%
70-74	57%	64%	62%	66%	65%	64%	63%	62%	51%	39%	58%
65-69	42%	48%	44%	39%	41%	38%	36%	34%	22%	19%	35%
60-64	40%	42%	38%	36%	35%	34%	30%	27%	23%	27%	33%
55-59	20%	25%	21%	20%	21%	22%	20%	20%	17%	17%	20%
50-54	14%	18%	13%	13%	13%	13%	13%	13%	13%	14%	14%
45-49	9%	14%	9%	11%	11%	11%	11%	11%	13%	14%	11%
40-44	7%	9%	9%	10%	10%	11%	10%	11%	12%	13%	10%
16-39	5%	7%	6%	8%	8%	8%	8%	8%	10%	10%	8%
Overall	15%	20%	18%	19%	20%	20%	19%	19%	20%	20%	23%

What happens if we vaccinate 3 million adults over the next 30 days?

100,000 vaccinations per day, top 20% highest incidence neighbourhoods

Potential impact at 60 days: % of cumulative cases averted, compared to no vaccination moving forward

Number vaccines per case averted

Key Findings
